LDAP/AD Policy Authority performs a lookup in an LDAP/AD and returns attributes from the AD. These attributes can then be passed to the parameters of the output policy configured.

Configuring the LDAP/AD Policy Authority

To configure the authority, complete the following steps.

- 1. Sign into the Administrative Console.
- 2. Click Create New Authority.
- 3. Ensure that LDAP/AD Policy Authority is selected in the Authority Type list box.
- 4. Type a name for the authority in the **Authority Name** box.
- 5. Type a name for the authority in the Authority Display Name box.
- 6. Type a description of the authority in the Authority Description box (optional).
- 7. Type the fully qualified URI location of the Resilient Access Authority Connector in the Resilient Access Authority Connector Host box, including the number of the port on the Resilient Access Authority Connector host that will accept incoming connections. To encrypt the communications between Resilient and the Resilient Access Authority Connector, type https. http[s]://fully_qualified_domain_name:port_number
- 8. Use the **Runtime Parameters** area to add and configure the parameters without literal values. The values of these parameters will be supplied by the end user at runtime. For each runtime parameter, specify the following:
 - Type the name of the parameter in the **Name** box. The parameter name gets paired with the value provided at runtime and sent to the custom REST authority.
 - Type the label of the box displayed to the end user in the **Display Name** box.
 - If the parameter will contain a sensitive value, such as personally identifiable information, select the **Obfuscate** check box. This instructs Resilient Access to substitute an opaque token for the value as it transits the network, ensuring that the value never passes through the central Policy Workflow Engine component and does not get stored in the Trust History.
 - If the user will provide the value in the initial request form, select the **Initial Request** check box. NOTE: Resilient recommends leaving the **Initial Request** check box blank if the value is sensitive or contains personally identifiable information.
 - Select the **Mask Input** check box to mask the values with bullet characters as the user types them in. This protects against shoulder surfing.
- 9. Configure the connection to the LDAP/AD server by entering:
 - 1. The LDAP Protocol connection URL using the ldap:// or ldaps:// scheme in the Connection URL box: ldap[s]://fully_qualified_domain_name:port_number
 - 2. The LDAP/AD server connection user **Distinguished Name (DN)** in the **Connection Name** box: e.g. *cn=admin,dc=acme,dc=com*
 - 3. The password for the user account to connect to the LDAP/AD server in the **Connection Password** box.
- 10. Configure how the user record for a member of the LDAP/AD will be found
 - Enter the base path within the LDAP/AD where user records are stored in the User Search Base box. This field allows multiple base paths to be entered, by clicking the "+" icon to the right of the text box. If more than one base path is specified, all the specified base

paths will be searched sequentially for the user record. e.g.

(ou=employees,dc=acme,dc=com) OR (ou=contractors,dc=acme,dc=com)

- 2. If sub-paths below the base path should be searched for the user record, then click on the **Search Subtree** checkbox
- 3. If entries within the LDAP/AD references other locations where user records are stored, then those locations will also be searched if the **Follow Referrals** checkbox is checked
- 4. Enter the name of the user record attribute in the LDAP/AD that will be the user identifier when searching for the user record in the User Identity Attribute box. For example if the authentication is performed based on email address as the identity attribute and the "mail" attribute hold the email address in the user record then mail should be entered for User Identity Attribute
- 5. Select the runtime parameter that will match the **User Identity Attribute** for the LDAP/AD record lookup
- 11. Specify the attributes to retrieve from the LDAP/AD by entering the attribute names in the LDAP/AD Attributes to retrieve section
- 12. Define the output policy and configure the policy parameters using the steps below
 - 1. Click the **Create Output Policy** button to define the output policy. The output policy is created in a popup window with a similar interface as the <u>Create Policies</u> page. Drag and drop authorities and define the output policy
 - 2. The **Configure Policy Parameters** table will list the parameters of the output policy. These can either be mapped to *Runtime Parameter* defined above or a *Literal* or a *Query Result*.
 - If Mapped Type is *Runtime Parameter* then Mapped Value will be populated with the runtime parameters defined. Select the one to use from the drop-down
 - If Mapped Type is *Literal* enter the value in the Mapped Value box
 - If **Mapped Type** is *Query Result* then **Mapped Value** will be populated with the attributes defined in the **LDAP/AD Attributes to retrieve** section. Select the one to use from the drop-down.
- 13. Once you have finished configuring the custom authority, click Create or Save.
