

We have taken the classic Java Blueprints Pet Store application and built a force.com version of it to demonstrate the steps of converting an existing force.com application into a “Trust Enabled” application with two factor authentication and other policies enforcement before access is allowed to parts of the application that have further restrictions.

Demo

- [Petstore](#)
- [Trust-enabled petstore](#)

1. Install the force.com package from [here](#). It's a typical force.com package installation which can simply select the default options. The post instructions can be found [here](#).
2. Two ways to setup Petstore application
  - Expose Petstore application via a VisualForce tab for Salesforce users, see [here](#)
  - Setup Petstore application as a public accessible force.com site, see [here](#)
3. Create policies for controlling access to the Petstore application through Resilient Access, see [here](#)
4. Trust Enable the Petstore application, see [here](#)
